Curso de React + Projeto COSTS Matheus Battisti (Hora de Codar)

Vídeos do curso:

https://www.youtube.com/watch?v=FXqX7oof0I4&list=PLnDvRpP8BneyVA0SZ2okm-QBojomniQVO

Resumo do curso feito por Roberto Pinheiro https://github.com/betopinheiro1005

Aula 01 - Introdução

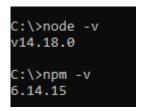

O que é React?

- Uma biblioteca JS para criação de interfaces;
- Utilizado para construir SPAs (Single Page Application);
- Baseado em componentes;
- Utiliza o JSX para renderizar HTML;
- E aplica o Virtual DOM para realizar as alterações de DOM;
- Podemos adicionar a um projeto ou criar um projeto com ele;

Aula 02 - Instalando o React

Como instalar o React?

- Para instalar o React vamos utilizar uma ferramenta chamada Create React App;
- Recebemos todos os arquivos da biblioteca e temos como executá-la;
- Para utilizar precisamos do Node e também npm;
- Esta ferramenta também otimiza o app gerado pela produção;
- É possível iniciar a aplicação com npm start
- Instale o Node e o Visual Studio Code

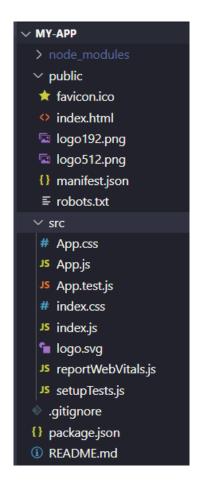

npx create-react-app my-app cd my-app

code . npm start

http://localhost:3000/

src\App.js

```
import './App.css';
function App() {
  return (
      <div className="App">
      <h1>Olá React!</h1>
      Meu primeiro App
      </div>
    );
}
export default App;
```

O localhost:3000

Olá React!

90% 🖒

Meu primeiro App

Aula 03 - Entendendo o JSX

- O JSX é como um HTML, porém dentro do código JavaScript;
- É a principal maneira de escrever HTML com o React;
- Podemos interpolar variáveis, inserindo ela entre {};
- É possível também executar funções em JSX;
- Inserir valores em atributos de tags também é válido em JSX;

```
src\App.js
import './App.css';
function App() {
 const name = "Matheus"
 const newName = name.toUpperCase()
 function sum(a,b){
  return a+b
 }
 const url = "https://via.placeholder.com/150/0000FF/FFFFF?Text=Digital.com"
 return (
  <div className="App">
   <h2>Alterando o JSX</h2>
   Olá, {newName}!
   Soma: {sum(2,3)} 
   <img src={url} alt="Minha imagem" />
  </div>
);
}
export default App;
 O localhost:3000
                                                                90%
                          Alterando o JSX
                              Olá, MATHEUS!
                                 Soma: 5
                                150 x 150
```

Aula 04 - Criando componentes no React

Componentes

- Permitem dividir a aplicação em partes;
- Os componentes renderizam JSX, assim como App.js (que é um componente);
- Precisamos criar um arquivo de componente;
- E importá-lo onde precisamos utilizar;
- Normalmente ficam em uma pasta chamada components;

src\components\Frase.js

src\components\HelloWorld.js

export default HelloWorld

```
src\App.js
```

```
import './App.css'
import HelloWorld from './components/HelloWorld'
function App() {
 const name = "Matheus"
 const newName = name.toUpperCase()
 function sum(a,b){
  return a+b
 }
 const url = "https://via.placeholder.com/150/0000FF/FFFFF?Text=Digital.com"
 return (
  <div className="App">
   <h2>Alterando o JSX</h2>
   Olá, {newName}!
   Soma: {sum(2,3)} 
   <img src={url} alt="Minha imagem" />
   <HelloWorld/>
  </div>
);
}
export default App;
```

Alterando o JSX

Olá, MATHEUS!

Soma: 5

Este é um componente com uma frase

Meu primeiro componente

Este é um componente com uma frase

Aula 05 - Trabalhando com props

- As props s\u00e3o valores passados para componentes;
- Podemos deixá-los dinâmicos;
- Ou seja, mudando a execução por causa do valor da prop;
- O valor é passado como um atributo na chamada do componente;
- E precisa ser resgatado dentro de uma propriedade/argumento chamada props na função de definição do componente;
- As props são somente de leitura!

src\components\SayMyName.js

export default App;

```
function SayMyName(props){
 return (
 <div>
   Fala aí, {props.name}, suave?
  </div>
)
}
export default SayMyName
src\App.js
import './App.css';
import HelloWorld from './components/HelloWorld';
import SayMyName from './components/SayMyName';
function App() {
 const name = "Maria"
 return (
  <div className="App">
   <HelloWorld/>
   <SayMyName name="Matheus" />
   <SayMyName name="João" />
   <SayMyName name={name} />
 </div>
);
}
```

Este é um componente com uma frase

Meu primeiro componente

Este é um componente com uma frase
Fala aí, Matheus, suave?
Fala aí, João, suave?
Fala aí, Maria, suave?

src\components\Pessoa.js

export default Pessoa

export default App;

src\App.js

```
import './App.css';
import HelloWorld from './components/HelloWorld';
import Pessoa from './components/Pessoa';
import SayMyName from './components/SayMyName';
function App() {
 const name = "Maria"
 return (
  <div className="App">
   <HelloWorld/>
   <SayMyName name="Matheus" />
   <SayMyName name="João" />
   <SayMyName name={name} />
   <Pessoa
    nome="Rodrigo"
    idade="28"
    profissao="programador"
    foto="https://via.placeholder.com/150"
   />
  </div>
 );
}
```

src\components\Pessoa.js

Meu primeiro componente

Aula 06 - Inserindo CSS no React

- O CSS pode ser adicionado de forma global na aplicação, por meio do arquivo index.css por exemplo;
- Porém é possível estiliizar a nível de componentes;
- Utilizamos o CSS modules para isso;
- Basta criar um arquivo como: Componente.module.css;
- E chamar este CSS no componente;

Usando CSS de forma global

src\App.js

export default App;

```
import './App.css';
import HelloWorld from './components/HelloWorld';
import Pessoa from './components/Pessoa';
import SayMyName from './components/SayMyName';
function App() {
 const name = "Maria"
 return (
 <div className="App">
   <h1>Testando CSS</h1>
   <HelloWorld/>
   <SayMyName name="Matheus" />
   <SayMyName name="João" />
   <SayMyName name={name} />
   <Pessoa
   nome="Rodrigo"
   idade="28"
   profissao="programador"
   foto="https://via.placeholder.com/150"
  />
  </div>
);
```

src\index.css

```
body {
  padding: 50px;
  background-color: #efefef;
}
h1{
  color: #333;
}
p{
  background-color: #999;
  padding: 10px;
}
```

Utilizando CSS a nível de componente

src\components\Frase.module.css

export default Frase

```
.fraseContainer{
 background-color: #333;
 border: 1px solid #111;
.fraseContent{
 color: #fff;
 background-color: #333;
 margin: 0;
}
src\components\Frase.js
import styles from './Frase.module.css'
function Frase(){
 return (
  <div className={styles.fraseContainer}>
   Este é um componente com uma frase
  </div>
)
}
```

src\App.js

```
import './App.css';
import Frase from './components/Frase';
import Pessoa from './components/Pessoa';
import SayMyName from './components/SayMyName';
function App() {
 const name = "Maria"
 return (
  <div className="App">
   <h1>Testando CSS</h1>
   <Frase />
   <Frase />
   <SayMyName name="Matheus" />
   <SayMyName name="João" />
   <SayMyName name={name} />
   <Pessoa
    nome="Rodrigo"
    idade="28"
    profissao="programador"
    foto="https://via.placeholder.com/150"
   />
  </div>
);
}
```

export default App;

Aula 07 - Utilizando React fragments

- Os React Fragments permitem a criação de um componente sem elemento pai;
- O propósito é descomplicar os nós do DOM;
- A sintaxe é <> e </>, não há um nome para a tag;
- Criamos no próprio JSX.

src\components\Item.js

return (

<> <h1>Minha lista</h1>

<ltem marca="Ferrari" />
<ltem marca="Fiat" />
<ltem marca="Renault" />

export default List

src\App.js

```
import './App.css';
import Frase from './components/Frase';
import List from './components/List';
import Pessoa from './components/Pessoa';
import SayMyName from './components/SayMyName';
function App() {
 const name = "Maria"
 return (
  <div className="App">
   <h1>Testando CSS</h1>
   <Frase />
   <Frase />
   <SayMyName name="Matheus" />
   <SayMyName name="João" />
   <SayMyName name={name} />
   <Pessoa
    nome="Rodrigo"
    idade="28"
    profissao="programador"
    foto="https://via.placeholder.com/150"
   />
   <List/>
  </div>
);
}
export default App;
```

Testando CSS

Este é um componente com uma frase

Este é um componente com uma frase

Fala aí, Matheus, suave?

Fala aí, João, suave?

Fala aí, Maria, suave?

Nome: Rodrigo

Idade: 28

Profissão: programador

Minha lista

Ferrari Fiat Renault

Aula 08 - Avançando em props

- Podemos definir tipos para as props, realizando uma espécie de validação;
- Definimos em um objeto chamado propTypes no próprio componente;
- E ainda há possibilidade de definir um valor padrão;
- Neste caso utilizamos o objeto defaultProps;

src\components\List.js

•

export default Item

src\components\Item.js

Testando CSS

Este é um componente com uma frase

Este é um componente com uma frase

Fala ai, Matheus, suave?

Fala ai, João, suave?

Fala ai, Maria, suave?

150 x 150

Nome: Rodrigo

Idade: 28

Profissão: programador

Minha lista

Ferrari - 1985 Frat - 1964 Renault - 0 Chevrolet - 1999 Faltou a marca - 0

:

Aula 09 - Eventos no React

- Os eventos de React são os mesmos eventos do DOM;
- Ou seja, temos eventos para responder a um click;
- O evento é atrelado a uma tag que irá executá-lo;
- Geralmente um método é atribuído ao evento;
- Este método deve ser criado no componente;

src\components\Evento.js

```
function Evento({numero}) {
 function meuEvento() {
  console.log(`Opa, fui ativado! ${numero}`)
 }
 return (
  <div>
   Clique para disparar o evento:
   <button onClick={meuEvento}>Ativar!</button>
  </div>
)
}
export default Evento
src\App.js
import './App.css';
import Evento from './components/Evento';
function App() {
 return (
  <div className="App">
   <h1>Testando Eventos</h1>
   <Evento numero="1" />
   <Evento numero="2"/>
  </div>
);
}
export default App;
```

src\components\Form.js

```
function Form(){
 function cadastrarUsuario(e){
  e.preventDefault()
  console.log("Cadastrou o usuário!")
 }
return(
  <div>
   <h1>Meu cadastro</h1>
   <form onSubmit={cadastrarUsuario}>
     <input type="text" placeholder="Digite o seu nome" />
     <input type="submit" value="Cadastrar" />
    </div>
   </form>
  </div>
export default Form
src\App.js
import './App.css';
```

export default App;

Aula 10 - useState na prática

- O useState é um hook do React;
- Com ele conseguimos manusear o estado de um componente de forma simples;
- Este hook funciona muito bem com eventos;
- Podemos atrelar um evento a mudança de state;

src\components\Form.js

export default Form

```
import { useState } from 'react';
function Form(){
function cadastrarUsuario(e){
  e.preventDefault()
  console.log(name)
  console.log('O usuário ${name} foi cadastrado com a senha ${password}')
 const [name, setName] = useState();
 const [password, setPassword] = useState();
 return(
  <div>
   <h1>Meu cadastro</h1>
   <form onSubmit={cadastrarUsuario}>
    <div>
     <div>
      <label htmlFor="name">Nome: </label>
      <input
       type="text"
       id="name"
       name="name"
       placeholder="Digite o seu nome"
       onChange={(e) => setName(e.target.value)}
      />
     </div>
     <div>
      <label htmlFor="password">Senha: </label>
       type="password"
       id="password"
       name="password"
       placeholder="Digite a sua senha"
       onChange={(e) => setPassword(e.target.value)}
     />
     </div>
     <input type="submit" value="Cadastrar" />
    </div>
   </form>
  </div>
)
}
```

src\App.js

export default App;

Aula 11 - Passar eventos por props

- Os métodos também podem ser passados por props;
- Ou seja, um componente filho pode ativar o método do seu ancestral;
- Vamos acessar o método por meio de um evento;
- A sintaxe é a mesma de uma props de dados: props.meuEvento;

src\components\evento\Button.js

```
function Button(props){
  return(
     <button onClick={props.event}>{props.text}</button>
)
}
export default Button
```

src\components\Evento.js

```
import Button from './evento/Button'
function Evento() {
function meuEvento() {
  console.log('Ativando primeiro evento!')
}
 function segundoEvento(){
  console.log("Ativando o segundo evento!")
 }
 return (
  <div>
   Clique para disparar o evento:
   <Button event={meuEvento} text="Primeiro evento" />
   <Button event={segundoEvento} text="Segundo evento" />
  </div>
)
}
```

export default Evento

Aula 12 - Renderização condicional (if)

- Podemos atrelar a exibição de algum elemento a um if;
- Esta ação é chamada de renderização condicional;
- Envolvemos as tags em chaves {};
- Como as chaves executam JavaScript, criamos nossa condição;
- É possível usar o state para criar as condições;

src\components\Condicional.js

export default Condicional

```
import { useState } from 'react'
function Condicional(){
const [email, setEmail] = useState()
 const [userEmail, setUserEmail] = useState()
 function enviarEmail(e){
  e.preventDefault()
  setUserEmail(email)
  console.log(userEmail)
 }
function limparEmail() {
  setUserEmail(")
 return (
  <div>
   <h2>Cadastre o seu e-mail:</h2>
   <form>
    <input type="email" placeholder="Digite o seu e-mail..." onChange={(e) => setEmail(e.target.value)} />
    <button type="submit" onClick={enviarEmail}>Enviar</button>
    {userEmail && (
     <div>
      O e-mail do usuário é: {userEmail}
      <button onClick={limparEmail}>Limpar e-mail
     </div>
    )}
   </form>
  </div>
```

```
src\App.js
```

export default App;

Cadastre o seu e-mail:
□ localhost:3000
□ localhost:3000
□ Renderização condicional
Cadastre o seu e-mail:
□ Digite o seu e-mail...
□ Enviar

Aula 13 - Renderização de listas

- Para renderizar uma lista vamos primeiramente precisar de um array;
- Depois utilizamos a função map, para percorrer cada um dos itens;
- Podendo assim renderizar algo na tela;
- É possível unir operadores condicionais com a renderização de listas;

src\components\OutraLista.js

```
function OutraLista({itens}){
 return (
  <>
   <h3>Lista de bibliotecas front-end</h3>
    itens.length > 0? (
     itens.map((item, index) => (
      {item}
     ))
   ):(
     Não há itens na lista!
    )
   }
  </>
)
export default OutraLista
src\App.js
import './App.css';
import OutraLista from './components/OutraLista';
function App() {
 const meusItens = ['React', 'Vue', 'Angular']
 return (
  <div className="App">
   <h1>Renderização de listas</h1>
   <OutraLista itens={meusItens} />
  </div>
);
}
export default App;
```

Aula 14 - State Lift

- State Lift é uma técnica utilizada para compartilhar o state;
- É normal vários componentes dependerem do mesmo estado;
- Então precisamos elevar o nível do mesmo a um componente pai;
- Então centralizamos o state no pai, e definimos quem usa e quem define (setState);

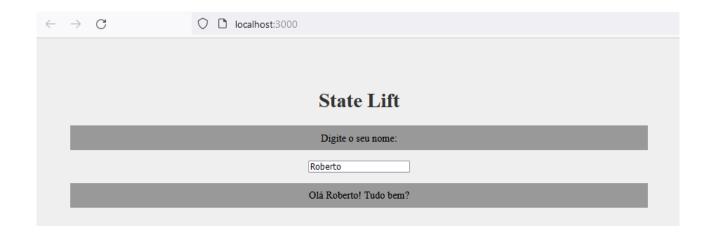

src\components\Saudacao.js

```
function Saudacao({nome}){
 function gerarSaudacao(algumNome){
  return 'Olá ${algumNome}! Tudo bem?'
 }
 return (
  <>
  {nome && {gerarSaudacao(nome)}}
  </>
)
export default Saudacao
src\components\SeuNome.js
function SeuNome({setNome}){
 return(
  <div>
   Digite o seu nome:
   <input type="text" placeholder="Qual é o seu nome?" onChange={(e) => setNome(e.target.value)} />
  </div>
)
}
```

export default SeuNome

src\App.js import { useState } from 'react'; import './App.css'; import Saudacao from './components/Saudacao'; import SeuNome from './components/SeuNome'; function App() { const [nome, setNome] = useState() return (<div className="App"> <h1>State Lift</h1> <SeuNome setNome={setNome} /> <Saudacao nome={nome} /> </div>); } export default App;

Aula 15 - Implementando o React Router

- O React Router é um pacote para mudança de URLs da aplicação;
- Podemos assim acessar outras views, sem o page reload;
- Trocando apenas uma parte do layout da aplicação, ou seja, o que muda de view para view;
- Precisamos instalar este pacote no projeto;
- E também realizar algumas mudanças em como o App é estruturado;

Instalando o pacote React-Router

npm install react-router-dom

src\pages\Home.js

```
function Home(){
  return(
      <div>
            <h1>Home</h1>
            Conteúdo da página
            </div>
        )
}
```

export default Home

src\pages\Empresa.js

export default Empresa

src\pages\Contato.js

export default Contato

src\App.js

```
import { BrowserRouter as Router, Link, Route, Routes } from 'react-router-dom';
import Contato from './pages/Contato';
import Empresa from './pages/Empresa';
import Home from './pages/Home';
function App() {
 return (
 <Router>
  ul>
   Link to="/">Home</Link>
   <Link to="/empresa">Empresa</Link>
   <Link to="/contato">Contato</Link>
  <Routes>
   <Route exact path="/" element={<Home />} />
   <Route path="/contato" element={<Contato />} />
   <Route path="/empresa" element={<Empresa />} />
   </Routes>
  </Router>
)
}
export default App;
 90% 🖒
                                                                       • Home
      • Empresa
      • Contato
    Home
     Conteúdo da página
← → C □ localhost:3000/empresa

                                                                                        Home Empresa Contato
      Empresa
       Conteúdo da página
```

Aula 16 - Icons

React Icons

- O React Icons é um pacote de ícones externo;
- Precisamos adicionar ao projeto através do npm;
- Ele nos permite adicionar ícones ao projeto com uma sintaxe parecida a de componentes;
- Além disso há uma grande quantidade de ícones disponíveis;

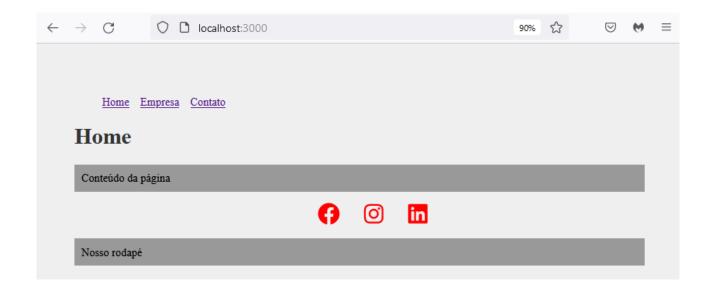

```
https://react-icons.github.io/react-icons/
npm install react-icons --save
```

src\components\layout\Footer.js

src\components\layout\Footer.module.css

```
.social_list{
  display: flex;
  justify-content: center;
  align-items: center;
  list-style: none;
}
.social_list li{
  margin: 0 1em;
}
.social_list svg{
  font-size: 2em;
  cursor: pointer;
  color: red;
}
```

export default Footer

Aula 17 - Criando o projeto

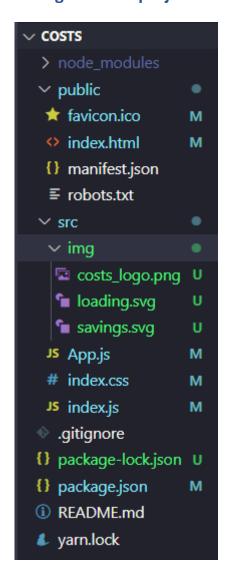

npx create-react-app costs cd costs

code . npm start

Instalando dependências do projeto

npm install json-server react-icons react-router-dom uuid

Configurando o projeto

https://github.com/matheusbattisti/curso_react_yt

```
src\App.js
function App() {
 return (
  <div className="App">
    Costs
  </div>
);
export default App;
src\index.js
import React from 'react';
import ReactDOM from 'react-dom';
import App from './App';
import './index.css';
ReactDOM.render(
 <React.StrictMode>
  <App />
 </React.StrictMode>,
 document.getElementById('root')
);
src\index.css
*{
 padding: 0;
 margin: 0;
 box-sizing: border-box;
 font-family: 'Open Sans', sans-serif;
}
html, body, #root{
 background-color: #efefef;
 height: 100%;
```

}

public\index.html

```
<!DOCTYPE html>
<html lang="en">
 <head>
  <meta charset="utf-8" />
  k rel="icon" href="%PUBLIC URL%/favicon.ico" />
  <meta name="viewport" content="width=device-width, initial-scale=1" />
  <meta name="theme-color" content="#000000" />
  <meta
   name="description"
   content="Web site created using create-react-app"
  k rel="apple-touch-icon" href="%PUBLIC URL%/logo192.png" />
   manifest.json provides metadata used when your web app is installed on a
   user's mobile device or desktop. See https://developers.google.com/web/fundamentals/web-app-manifest/
  -->
  <link rel="manifest" href="%PUBLIC_URL%/manifest.json" />
  <!--
   Notice the use of %PUBLIC_URL% in the tags above.
   It will be replaced with the URL of the `public` folder during the build.
   Only files inside the 'public' folder can be referenced from the HTML.
   Unlike "/favicon.ico" or "favicon.ico", "%PUBLIC URL%/favicon.ico" will
   work correctly both with client-side routing and a non-root public URL.
   Learn how to configure a non-root public URL by running `npm run build`.

Aula 18 - Estruturando o projeto

Nesta aula estruturaremos o nosso projeto de #React

O início deve ter bases sólidas, para que não seja preciso voltar e modificar detalhes que poderiam ser configurados quando o projeto é criado, este vídeo se dedica justamente a isso: criar um bom alicerce no nosso projeto!

src\App.js

export default Container

```
import { BrowserRouter as Router, Link, Route, Routes } from 'react-router-dom'
import Container from './components/layout/Container'
import Company from './components/pages/Company'
import Contact from './components/pages/Contact'
import Home from './components/pages/Home'
import NewProject from './components/pages/NewProject'
function App() {
 return (
  <Router>
   <div>
    <Link exact to='/'>Home</Link>
    <Link to='/company'>Empresa</Link>
    <Link to='/contact'>Contato</Link>
    <Link to='/newproject'>Novo Projeto</Link>
   </div>
   <Container customClass="min-height">
    <Routes>
      <Route exact path="/" element={<Home />} />
      <Route path="/company" element={<Company />} />
      <Route path="/contact" element={<Contact />} />
      <Route path="/newproject" element={<NewProject />} />
    </Routes>
   </Container>
   Footer
  </Router>
);
export default App;
src\components\layout\Container.js
import styles from './Container.module.css'
function Container(props){
  <div className={`${styles.container} ${styles[props.customClass]}`}>
   {props.children}
  </div>
)
}
```

src\components\layout\Container.module.css

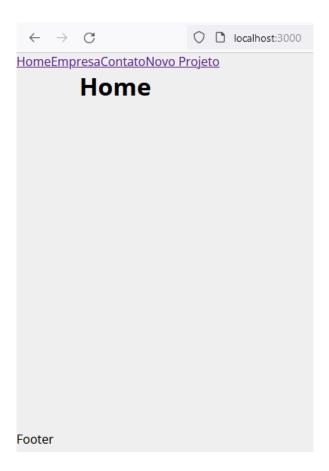

```
.container{
 width: 1200px;
 display: flex;
 justify-content: space-between;
 margin: 0 auto;
 flex-wrap: wrap;
.min-height{
min-height: 75%;
.start{

Aula 28 - Criando componente de loader

```
npm start
npm run backend
src\components\layout\Loading.js
import loading from '../../img/loading.svg'
import styles from './Loading.module.css'
function Loading(){
 return(
  <div className={styles.loader_container}>
   <img className={styles.loader} src={loading} alt="Loading" />
  </div>
)
}
export default Loading
src\components\layout\Loading.module.css
.loader_container{
 width: 100%;
 height: 100%;
 display: flex;
justify-content: center;
 align-items: center;
}
.loader{
 width: 50px;
}
src\components\pages\Projects.js
import { useEffect, useState } from 'react'
import { useLocation } from 'react-router-dom'
import Container from '../layout/Container'
import LinkButton from '../layout/LinkButton'
import Loading from '../layout/Loading'
import Message from '../layout/Message'
import ProjectCard from '../project/ProjectCard'
import styles from './Projects.module.css'
function Projects(){
 const [projects, setProjects] = useState([])
 const [removeLoading, setRemoveLoading] = useState(false)
 const location = useLocation()
```

```
let message = "
if(location.state){
 message = location.state.message
}
useEffect(() => {
 setTimeout(() => {
  fetch("http://localhost:5000/projects", {
   method: 'GET',
   headers: {
    'Content-Type': 'application/json'
  }).then(resp => resp.json())
   .then(data => {
    console.log(data)
    setProjects(data)
    setRemoveLoading(true)
   .catch((err) => console.log(err))
  }, 300);
 }, []);
return(
 <div className={styles.project_container}>
  <div className={styles.title_container}>
   <h1>Meus Projetos</h1>
   <LinkButton to="/newproject" text="Criar Projeto" />
  </div>
  {message && <Message type="success" msg={message} />}
  <Container customClass="start">
   {projects.length > 0 &&
    projects.map((project) => (
     <ProjectCard
     id={project.id}
     name={project.name}
     budget={project.budget}
     category={project.category.name}
     key={project.id}
     />
    )) }
    {!removeLoading && <Loading />}
    {removeLoading && projects.length === 0 && (
